We're developing the following programs, hope to release them as open source projects on SourceForge, and hope to find users interested in supporting their further development:

RecolorTemplate

- [wxPython](#) GUI to easily rotate the hues of the colors found in the CSS and graphics files of a website's template. Just move a slider and your whole template changes from one set of coordinated colors to a new set of coordinated colors!
  - Alpha quality right now; it works but is a little rough around the edges

Library Task Manager

- [wxPython](#) GUI to speed entering periodical sets into the [Sagebrush Spectrum](#) library catalog software, and printing labels for sets of books currently in the catalog. Includes QuickDiff.
  - Beta quality

QuickDiff

- Simple [wxPython](#) GUI to show differences between text pasted into two text boxes. Avoids having to save text as a file before seeing the diff.
